XFT Solution Suite 4S4

Fiori Surfaces

SAP® Certified
Integration with SAP S/4HANA®

With the XFT Solution Suite 4S4, you can recreate your specialized processes with XFT standard building blocks. We have paid special attention to the Fiori surfaces. We lay the foundation for replacing your self-built surfaces with the XFT standard. For example, you are switching from older SAP GUI or WebDynpro-based interfaces to SAPUI5. This makes you future-proof and at the same time reduces the amount of in-house developments that are difficult to maintain. All XFT interfaces can be expanded and combined according to your needs, most of the expansion points can be filled by ABAP developments, so that you can e.g. be able to integrate your own logic that already exists.

In the following, we present important building blocks for your solution:

Search/Entry

All processes have to start once and the team members have to find existing processes to edit them or create missing ones. With the XFT GRP search framework, you can map searches and display bounces. The search in many variants is already prepared here, all you have to do is provide your specific data from the SAP system. Thanks to the Fiori catalogs, you can easily define different search variants for different user groups and distribute Fiori tiles to the appropriate target groups. Do you need more functions in the search? Often, for example, the creation of a new transaction or the start of a release is desired. Thanks to the XFT activity concept, all this is already prepared.

Recording of data via mask/form

When a process starts, data usually has to be collected. Often the data is also adjusted afterwards. For many cases, you can use the Dynamic Form of the XFT here. This form is a configurable input mask that offers different types of input fields free text, date, dropdowns, checkboxes, etc., along with validation rules and accessibility features.

The screenshot shows a mobile application interface for changing working hours. The form is displayed on a tablet and includes the following fields and options:

- Arbst. Woche: 40,00
- Arbeitsstage: 5,00
- BeschGrad: 100,00
- Referenzdatum: 01.10.2024
- Wirksamkeitsdatum: 01.10.2024 (with a calendar icon)
- Arbst. Woche: 0,00 (input field)
- BeschGrad: 0,00 (input field)
- Befristung: NEIN
- Gültig bis: 31.12.9999 (with a calendar icon)
- Wochentage: Montag, Dienstag, Mittwoch, Donnerstag, Freitag, Samstag, Sonntag

At the bottom of the form, there is a blue button labeled "Übernehmen". Below the form, there are three links: "0", "Abbrechen", and "Zurücksetzen".

Document Storage/Document Collection

Many processes contain documents as central objects: from technical inspection reports to e-mails from business partners to scanned (application) forms.

To collect these documents, XFT has its file solution with XFT Task Manager 4S4. Documents can be uploaded, classified and stored in a structured manner here. Access can be restricted based on roles (e.g., certain documents in personnel files are more critical than others, and in some sales processes, calculations are only visible to a small group).

Workflow/Process Integration

When it comes to processes, workflows are not far away. With the XFT Compliance Cycle 4S4, XFT provides a flexible tool. Regardless of whether employees need to receive information on planned process steps or whether additional approval is required on an ad hoc basis: the XFT Compliance Cycle 4S4 already maps this and also supports multi-level approvals. Who receives the workflow can be stored by rule or set spontaneously at the start of the release, together with rules on what should happen when rejecting a release, for example.

The current editors can be informed by e-mail or you can use a task list from the Fiori Launchpad.

Authoring

Whether personnel process or sampling, whether quotation process or contract negotiation, in many cases documents have to be created, e.g. to document the results of a process or to send proposals to external process participants. With XFT Document Composer 4S4, you can automatically create documents based on your templates and data from the SAP system.

After the creation of documents, follow-up steps are often necessary. Of course, you can start all these steps, such as additional approvals or the request for electronic signatures or manual processing of the created document, in the SAPUI5 interfaces.
